Foreword

Electronic waste (e-waste) is the fastest-growing waste stream in the world, a silent but significant contributor to environmental degradation, especially in developing countries. At Tech Nora, we believe that digital innovation should not come at the expense of planetary health.

As a UK-based, remote software development company, we may not operate factories or data centers, but we recognize our responsibility in the digital value chain. From the devices we use to the platforms we build, our work touches the broader landscape of tech-driven consumption and waste.

This Sustainability Policy outlines our commitment to:

- Reducing our contribution to e-waste by extending device lifecycles
- Choosing responsible procurement and disposal methods
- Integrating sustainability thinking into our operations and digital products
- Advocating for circular practices in tech, even as a small-scale company

We are proud to be part of a growing movement of digital businesses that are embracing sustainability not as a reflection or an addendum, but as a design principle. This is our small but intentional step toward shaping a cleaner, smarter, more responsible digital economy.

Adepeju Paige
Head of Sustainability

Introduction

At TechNora, we believe that digital innovation must be responsible, not just functional. As a UK-based remote company, we develop digital solutions that promote environmental sustainability. Our focus is clear: to raise awareness around the reducing electronic waste and to support small-scale tech users in building responsible digital habits.

We created this policy to set a clear, shared commitment to environmental and social responsibility across our operations and decision-making.

This document guides how we approach everything from procurement and device usage to internal education and partnerships. It ensures that we align our practices with global frameworks; including the United Nations Sustainable Development Goals (SDGs) and the UK's Net Zero Strategy, while being transparent about the values we stand for.

TechNora's mission is to create smart, ethical, and low-impact digital solutions. Our commitment to addressing e-waste is an extension of that mission. We want to reshape how people think about their devices, extend their tech's lifecycle, and reduce the culture of digital disposability.

This document serves not only our internal team but also other early-stage companies that may be searching for guidance. Sustainability in tech is not yet standard practice, and we believe TechNora can be part of the movement to change that. By documenting our principles and progress, we hope to create a spark, ignite an action in our sector and beyond.

As a small company with big intentions, we are committed to building responsibly: reducing harm, increasing awareness, and doing our part to leave the world better than we found it.

Background & Framework

The growing crisis of electronic waste (e-waste) is what inspired Tech Nora to take sustainability seriously. Millions of electronics end up in landfills every year, often with harmful consequences for the environment and vulnerable communities. Even small companies like ours have a responsibility to help break that cycle by reshaping how we think about the devices we use, buy, and discard.

As a digital company, we understand that we cannot continue to build software and digital products without accounting for the environmental cost of the hardware behind them. Major tech manufacturers like Samsung have begun to reuse internal components across multiple product generations, a shift that reflects the urgent need for more circular thinking in tech. Tech Nora wants to be part of that shift.

To guide our sustainability efforts, we align with the following global frameworks:

- **Extended Producer Responsibility (EPR):** We recognize the need to be accountable for the environmental impact of the full product lifecycle, even as a service-based company.
- **UK Net Zero Strategy:** As a UK-based business, we aim to support national goals for carbon reduction and climate resilience.
- **UN Sustainable Development Goals (SDGs):** Particularly SDG 9 (Industry, Innovation and Infrastructure), SDG 12 (Responsible Consumption and Production), and SDG 13 (Climate Action).
- **Circular Economy Principles:** We embrace strategies like reuse, reduce, recycle, redesign, and refurbish, embedding them into our procurement, digital habits, and staff engagement.

Globally, e-waste is the fastest-growing solid waste stream. In 2023 alone, an estimated **59.4 million metric tonnes** of e-waste were generated, a figure expected to double by 2050. Shockingly, **less than 20%** of this is formally recycled. The digital tools we create to solve problems often become part of the waste problem themselves. That's why the tech industry urgently needs new thinking and why Tech Nora is stepping forward to be part of that solution.

We believe leadership isn't about size but **about setting an example**. While we are a small company, we are committed to acting with big intention. Sustainability is a mindset; we're cultivating one that leads with responsibility, not excess. Small, consistent actions taken intentionally can build the foundation for systemic change.

Objectives

The company commits to these objectives to promote sustainability and strengthen environmental responsibility across its operations

- a. Reduce our contribution to electronic waste by extending device lifecycles.
- b. Minimizing unnecessary upgrades and promoting conscious device use within the company and its partner network.
- c. Build a sustainability culture within our team by integrating environmental awareness into onboarding, digital habits, and company-wide communication.
- d. Adopt procurement practices that prioritize long-lasting, repairable, and energy-efficient devices, sourced from vendors who uphold circular economy principles.
- e. Advocate for responsible tech use by producing educational content and resources that help other small tech companies reduce their digital footprint.
- f. Align with global environmental frameworks including the UK Net Zero Strategy, the UN SDGs, EPR, and Circular Economy models to ensure our operations reflect best practices.
- g. Continuously evaluate and update our practices, ensuring our sustainability efforts grow alongside our business.

Principles

At Tech Nora, our sustainability commitment is built on the following guiding principles:

a. Responsibility

We believe that every company, no matter how small, must be environmentally conscious and accountable. We take ownership of our environmental impact and act with intention.

b. Transparency

We are committed to showing, not just telling. Sustainability for us means making visible, verifiable changes that others can follow and build upon.

c. Innovation

We position ourselves as pioneers in sustainable tech thinking. We apply creative, forward-thinking solutions to tackle issues like e-waste and responsible device use.

d. Continuous Improvement

We embrace growth, adaptability, and a mindset of evolution. Our team is committed to learning, unlearning, and improving how we operate; individually and collectively.

e. Action over Performance

We do not engage in performative “green” language. Instead, we strive to make measurable, practical impact in our daily work and systems.

f. Collective Sustainability

Sustainability is everyone’s role. Whether you're writing code or managing operations, each person at Tech Nora shares responsibility for building a sustainable future.

Implementation

At TechNora, sustainability is more than a written policy. It is a living practice embedded into how we think, operate, and evolve. As a remote company, our environmental footprint may differ from traditional setups, but our responsibility remains just as significant. We believe that strategic intentions only become meaningful when matched with consistent, everyday action.

Sustainability at TechNora is currently led by a Head of Sustainability, supported by our Business Analyst and a culture of shared ownership across roles. Though our team is still small, we are intentional about integrating sustainability thinking into every function, from how our developers write and test software to how we approach business decisions, team engagement, and digital infrastructure. As the company grows, we will gradually build a diverse sustainability team while ensuring that every team member understands their role in achieving our environmental goals.

Our operational approach focuses on what we can control and influence, promoting energy-conscious behaviors, encouraging responsible tech use, and leveraging our remote work culture to reduce emissions. We acknowledge that not every sustainable habit can be enforced, especially in a decentralized model, so we rely on education, culture-setting, and internal communications to shape awareness and action. Sustainability isn't an obligation here; it's an invitation to think better.

To measure and improve our efforts, we run quarterly retrospectives that include reflection on how sustainability has been considered in projects, sprints, and company-wide practices. Annually, we compile a year-end review summarizing key actions, challenges, and areas for growth. Where applicable, tools like Azure DevOps help us tag and track sustainability-linked tasks, keeping our progress visible. Regular updates are shared via our communication platforms, and sustainability expectations are included in onboarding and governance documentation to ensure alignment from day one.

Ultimately, this policy is not just about today's TechNora. It is about who we are becoming. We are building structures, habits, and systems that allow us to scale responsibly, evolve continuously, and contribute meaningfully to global environmental goals — even as a small company.
